In computer graphics, environment mapping, or reflection mapping, is an

efficient image-based lighting technique for approximating the appearance of a reflective surface by means of a precomputed texture. The texture is used to store the image of the distant environment surrounding the rendered object.. Several ways of storing the surrounding environment have been employed.

Chemical imaging (as quantitative – chemical mapping) is the analytical capability to create a visual image of components distribution from simultaneous measurement of spectra and spatial, time information. Hyperspectral imaging measures contiguous spectral

bands, as opposed to multispectral imaging which measures spaced spectral bands.
